**OBJECTIVE:**

To provide guidance for the peri-operative management of patients who are receiving a newer direct oral anticoagulant (DOAC) and require an elective surgery/procedure.

For guidance on management of patients who require an urgent or emergency surgery/procedure, please refer to the Perioperative Anticoagulant Management Algorithm found on the Thrombosis Canada website under the “Tools” tab.

**BACKGROUND:**

Four DOACs (apixaban, dabigatran, edoxaban and rivaroxaban) are approved for clinical use in Canada based on findings from large randomized trials.

The peri-operative management of DOAC-treated patients aims to interrupt anticoagulant therapy (if necessary) so there is no (or minimal) residual anticoagulant effect at the time of surgery, and to ensure timely but careful resumption after surgery so as to not incur an increased risk for post-operative bleeding.

There are 3 important considerations for peri-operative management of patients taking a DOAC:

1) Reliable laboratory tests to confirm the absence of a residual anticoagulant effect of DOACs are not widely available.
2) Half-lives of DOACs differ and increase with worsening renal function, affecting when the drug should be stopped before surgery.
3) DOACs have rapid onset of action, with a peak anticoagulant effect occurring 1-2 hours after oral intake.

In the absence of laboratory tests to reliably measure their anticoagulant effect, the peri-operative administration of DOACs should be influenced by:

1) Drug elimination half-life (with normal renal function),
2) Effect of renal function on drug elimination half-life, and
3) Bleeding risk associated with the surgery/procedure type (Table 1), and
4) Whether patient is to receive spinal/epidural anesthesia.

*NOACs/DOACs* = Non-vitamin K antagonist Oral AntiCoagulants, also known as Direct Oral Anticoagulants
EVIDENCE SUPPORTING PERI-OPERATIVE MANAGEMENT OF PATIENTS TAKING A DOAC:

There are emerging data relating to the efficacy and safety of the proposed peri-operative management of DOAC-treated patients. In RELY, a trial comparing dabigatran (150 mg or 110 mg) with warfarin for stroke prevention in atrial fibrillation, there were >4,500 patients who had anticoagulant interruption for a surgery/procedure. The incidence of peri-operative bleeding was similar in dabigatran- and warfarin-treated patients, suggesting that dabigatran-treated patients can be safely managed peri-operatively. Similar findings have been observed for the peri-operative management of apixaban-treated and rivaroxaban-treated patients. Studies on the peri-operative management of edoxaban-treated patients are pending.

PERI-OPERATIVE MANAGEMENT:

Patients Receiving Dabigatran

Pre-operative Management (Table 2):

- **LOW BLEED RISK Surgery/Procedure**: In patients who require a minor dental procedure, cataract procedure, or minor skin procedure; it is likely safe not to interrupt anticoagulation (as is done in warfarin-treated patients) but data to support such practice is lacking. An alternative approach would be to hold dabigatran on the day of the procedure or, if dabigatran is not interrupted, to delay that day’s dose for 4-6 hours after the procedure.

- **MODERATE BLEED RISK Surgery/Procedure**: Stop dabigatran 1 day before surgery/procedure (i.e. skip 2 doses before a surgery/procedure), which corresponds to approximately 2-3 half-lives elapsed between stopping dabigatran and surgery. There may be a 12-25% anticoagulant effect at the time of surgery, which is acceptable for these procedures.

- **HIGH BLEED RISK Surgery/Procedure (includes any neuraxial anesthesia)**: Depending on renal function, stop dabigatran 2 or 4 days before surgery (i.e. skip 4 or 8 doses), which corresponds to approximately 4-5 half-lives elapsed between stopping dabigatran and surgery. This ensures minimal (3-6%) residual anticoagulant effect at the time of surgery and allows patients to have spinal anesthesia or high bleeding risk surgery (e.g. intracranial or cardiac).

- If renal function is moderately impaired (CrCl 30-49 mL/min), 1-2 additional days of interruption is required to ensure elimination of any residual anticoagulant effect, as 80% of dabigatran is cleared by the kidneys.

Post-operative Management (Table 3):

Resumption of dabigatran 150 mg or 110 mg twice daily should be done cautiously after major surgery or in patients at increased bleeding risk, as this is a therapeutic-dose which is higher than that used for post-operative VTE prevention.

Patients Receiving Rivaroxaban

Pre-operative Management (Table 2):

- **LOW BLEED RISK Surgery/Procedure**: In patients who require a minor dental procedure, cataract procedure, or minor skin procedure; it is likely safe not to interrupt anticoagulation
(as is done in warfarin-treated patients) but data to support such practice is lacking. An alternative approach would be to hold rivaroxaban on the day of the procedure or, if rivaroxaban is not interrupted, to delay that day’s dose for 4-6 hours after the procedure.

- **MODERATE BLEED RISK Surgery/Procedure:** Stop rivaroxaban 1 day before surgery/procedure (i.e. skip 1 dose), which corresponds to approximately 2-3 half-lives elapsed between stopping rivaroxaban and surgery.

- **HIGH BLEED RISK Surgery/Procedure (includes any neuraxial anesthesia):** Stop rivaroxaban 2 days before surgery (i.e. skip 2 doses), which corresponds to approximately 4-5 half-lives elapsed between stopping rivaroxaban and surgery.

*Post-operative Management (Table 3):*
Resumption of rivaroxaban 20 mg (or 15 mg if usual dose) once daily should be done cautiously after major surgery or in patients at increased bleeding risk, as this is a therapeutic-dose which is higher than that used for post-operative VTE prevention.

**Patients Receiving Apixaban**

*Pre-operative Management (Table 2):*

- **LOW BLEED RISK Surgery/Procedure:** In patients who require a minor dental procedure, cataract procedure, or minor skin procedure; it is likely safe not to interrupt anticoagulation (as is done in warfarin-treated patients) but data to support such practice is lacking. An alternative approach would be to hold apixaban on the day of the procedure or, if apixaban is not interrupted, to delay that day’s dose for 4-6 hours after the procedure.

- **MODERATE BLEED RISK Surgery/Procedure:** Stop apixaban 1 day before surgery/procedure (i.e. skip 2 doses), which corresponds to approximately 2-3 half-lives elapsed between stopping apixaban and surgery.

- **HIGH BLEED RISK Surgery/Procedure (includes any neuraxial anesthesia):** Stop apixaban 2 days before surgery (i.e. skip 4 doses), which corresponds to approximately 4-5 half-lives elapsed between stopping apixaban and surgery.

*Post-operative Management (Table 3):*
Resumption of apixaban 5 mg twice daily should be done cautiously after major surgery or in patients at increased bleeding risk, as this is a therapeutic-dose which is higher than that for post-operative VTE prevention.

**Patients Receiving Edoxaban**

*Pre-operative Management (Table 2):*

- **LOW BLEED RISK Surgery/Procedure:** In patients who require a minor dental procedure, cataract procedure, or minor skin procedure; it is likely safe not to interrupt anticoagulation (as is done in warfarin-treated patients) but data to support such practice is lacking. An alternative approach would be to hold edoxaban on the day of the procedure or, if edoxaban is not interrupted, to delay that day’s dose for 4-6 hours after the procedure.
• **MODERATE BLEED RISK Surgery/Procedure**: Stop edoxaban 1 day before surgery/procedure (i.e. skip 1 dose), which corresponds to approximately 2-3 half-lives elapsed between stopping edoxaban and surgery.

• **HIGH BLEED RISK Surgery/Procedure (includes any neuraxial anesthesia)**: Stop edoxaban 2 days before surgery (i.e. skip 2 doses), which corresponds to approximately 4-5 half-lives elapsed between stopping edoxaban and surgery.

*Post-operative Management (Table 3):*

Resumption of edoxaban 60 mg or 30 mg daily should be done cautiously after major surgery or in patients at increased bleeding risk, as this is a therapeutic-dose.

SPECIAL CONSIDERATIONS:

Patients with Impaired Renal Function:
An approach to managing patients with mild-to-moderate renal dysfunction is shown in Table 1, but for patients with severe renal dysfunction (CrCl <30 mL/min) who are generally ineligible for DOACs, peri-operative management is unclear.

Need for Bridging in DOAC-treated Patients:
In general, the rapid offset and onset of action of DOACs obviates the need for ‘heparin bridging’ as is done in selected warfarin-treated patients.

Pediatrics:
There are no studies evaluating the use of DOACs in children, although studies are underway. DOACs in children are not recommended until dosing, safety and efficacy are confirmed.
